Smart Internet Searching

1. Use Directories

Directories will help you organize items into categories, typically **sorted** alphabetically so you could easily focus your search. It is available in most search engines such as Yahoo and Google. Directories will only provide a few sites per category but most probably the best sites on the topic you're searching.

2. Go For Precise Terms

Since some terms mostly have one or more meanings, try to use unique terms that are specific to the topic you are searching so that the number of returned pages will reduce. For example, enter "Japanese food Los Angeles", instead of "California restaurants." Using **precise** terms will help you find accurate results.

3. Add Wildcard Characters (*)

Wildcard characters are special characters that will help you fill in the blanks. By using a wildcard character in a query it will help you locate a specific item when you can't remember exactly how it is spelled. For example, entering "breathtaking *" will return sites with breathtaking and other words the search engine considers relevant.

4. Put Minus Operator (-)

Search engines usually show something totally unexpected. For example, when searching the fruit apple, references to the company Apple, Inc. will also return. You may simply put "Apple - Inc" to **exclude** references to the company. Simply using the minus operator will help you remove unwanted results.

5. Use quotation marks (' ') (" ")

If you want to **track down** some part of a phrase you have seen on a web page, you may simply use quotation marks. For example, you may type "crows could recognize human faces". Using a quotation mark in the search engine will give you sites with exact phrasing.
